help.html

HTML

```
<!DOCTYPE html>
<html lang="en">
<head>
    <meta charset="UTF-8">
    <title>Help - Community Event Portal</title>
</head>
<body>
    <h1>Help Page</h1>
    <p>For assistance with event registration, contact the city office at 555-1234 or email
    contact@cityevents.gov.</p>
</body>
</html>
```

Exercise 1 — Base template & DevTools

The `<!DOCTYPE html>`, `lang="en"`, and `<meta charset="UTF-8">` are already in the head of `index.html`. Comments like `<!-- Navigation -->`, `<!-- Main -->`, `<!-- Footer -->` mark each section. Save the file, open it in Chrome, right-click → Inspect to see the DOM tree in Elements tab.

Exercise 2 — Navigation

The `<nav>` bar has anchor links pointing to `#home`, `#events`, `#contact`, which match the `id` attributes on each `<section>`. The Help link opens `help.html` in a new tab via `target="_blank"`.

Exercise 3 — Welcome banner

`#welcomeBanner` has a blue background set through internal CSS. The special offer text uses an inline style directly on the `<span>` (red, bold). The `.highlight` class is reused wherever you want a quick visual emphasis.

Exercise 4 — Image gallery

A 2-row, 3-column table holds six `<img>` tags, each with `alt`, `title`, and a `.imgBorder` class for consistent styling. Captions sit under each image as plain text (you could swap these for `<figcaption>` if you restructure with `<figure>`).

Exercise 5 — Registration form

Covers text, email, date, select, and textarea inputs. `placeholder`, `required`, and `autofocus` are applied. On submit, `showConfirmation()` writes a message into the `<output>` element instead of reloading the page.

Exercise 6 — Event handling

- `onblur` on the phone field runs a regex check for 10 digits.
- `onchange` on the dropdown displays the fee tied to the selected option via a `data-fee` attribute.
- `onclick` on the submit button pops an alert confirmation.
- `ondblclick` on any gallery image toggles its width between 150px and 300px to simulate "enlarging."
- Keyup on the textarea updates a live character counter.

Exercise 7 — Video

The `<video>` element loads `promo.mp4` with controls. `oncanplay` sets a "Video ready to play" message. `window.onbeforeunload` warns the user if they try to leave while the name field is filled in but the form hasn't been submitted.

Exercise 8 — Storage

`savePreference()` writes the selected event type to both `localStorage` and

`sessionStorage`. On page load, `window.onload` checks `localStorage` and pre-selects the saved value. `clearPreference()` removes both.

Exercise 9 — Geolocation

Clicking "Find Nearby Events" calls `getCurrentPosition()` with `enableHighAccuracy: true`. Success shows coordinates; failure branches on `PERMISSION_DENIED` and `TIMEOUT` to show a friendly message instead of a raw error.

Exercise 10 — Debugging

Once you have this file running:

- Right-click any element → Inspect Element, then edit CSS live in the Styles pane to test changes.
- Open the Console tab — add a `console.log()` inside any of the JS functions above (e.g. inside `countChars()`) to watch values as you interact with the page.
- In Chrome DevTools' Sources tab (or VS Code with the JavaScript Debugger), click a line number to set a breakpoint inside `findLocation()` or `validatePhone()`, then reload and step through with the debugger to watch variable values change.
